

## SHALLOW MARSH: Operation and Maintenance

- Inspect forebay after each storm event. If sediment buildup exceeds 4 inches, cleanout operations need to be facilitated.
- Remove accumulated paper, trash and debris after every storm event, as necessary.
- Annually inspect and repair the gabion structures, as needed.
- Vegetation growing on the embankment top or faces is not allowed to exceed 18 inches in height at any time.
- Corrective maintenance is required anytime the forebay does not drain down to the designed surface elevation within 60 hours.
