# Northern Little Patuxent River Watershed Assessment

#### COMMUNITY MEETING NO. 2 December 10, 2015

## Meeting Outline

- Welcome and Introductions
- Reasons for Study
- Watersheds 101
- Current Watershed Conditions
- Assessment Results
- Restoration Toolbox
- Countywide Implementation Strategy (CIS)
- Q&A Information Stations

# Why is the County doing a Watershed Assessment?

- Municipal Separate Storm Sewer System (MS4) National Pollutant Discharge Elimination System (NPDES) permit
  - Permit requires treatment of 20% of currently untreated impervious
  - Perform a comprehensive watershed assessment for the entire County within five year permit term
    - Little and Middle Patuxent Rivers in FY15 (Permit Year 1)
    - Patapsco and Mainstem Patuxent Rivers in FY16 (Permit Year 2)
  - Develop a Countywide restoration plan in Year 1 (CIS)
- Total Maximum Daily Load (TMDL) "pollutant diet" for nutrients
- Looking for cost-effective opportunities for environmental restoration (List of projects)

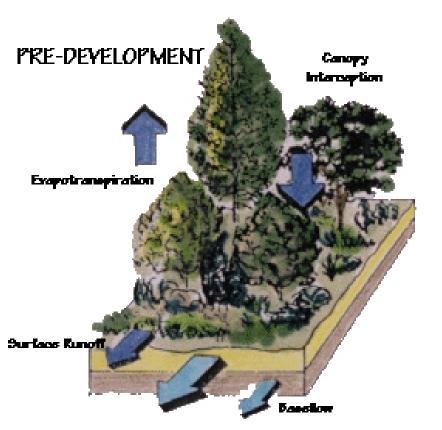

#### Chesapeake Bay TMDL

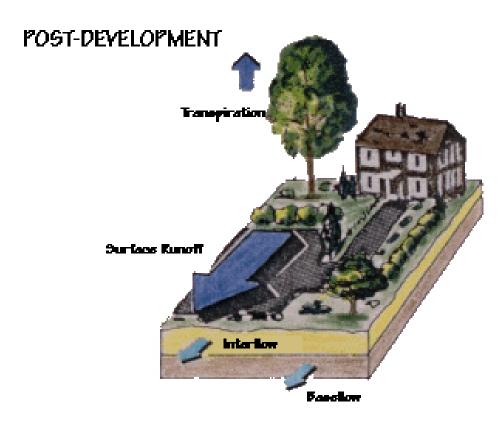

- Chesapeake Bay TMDL Sectors:
  - Agriculture
  - Forest
  - Septic
  - Wastewater
  - Urban Stormwater
- NPDES Permit Year 1 Restoration Plans for All Existing TMDL Waste Load Allocations (Bay and Local)
- All Sectors Reduce Phosphorus (P) by ~30% and Nitrogen (N) by ~40% (approx. half of total reduction is urban stormwater)
- Bay TMDL Meet 60% by 2017 and 100% by 2025

## Watersheds 101

#### WATER BALANCE

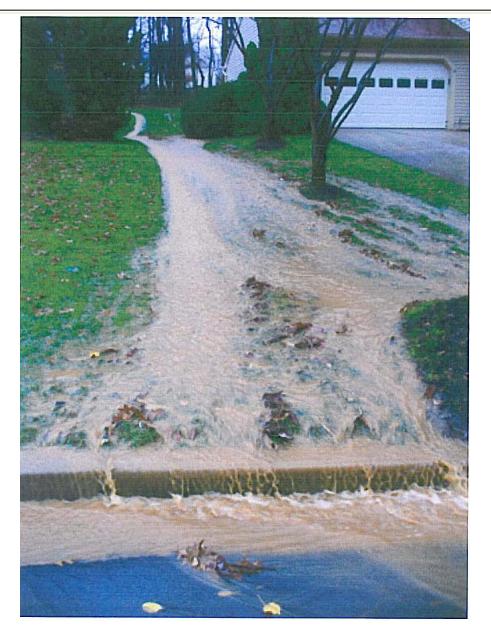

## Where does storm water go?

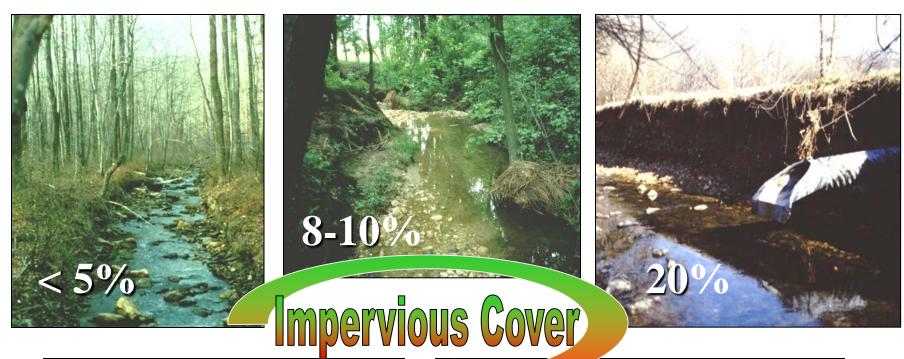

- A. To a wastewater treatment plant so pollutants and trash can be removed before the water goes to a nearby stream.
- B. To a nearby stream without any treatment.
- C. To a stormwater management facility for pollutant removal and then to a nearby stream.
- D. B or C

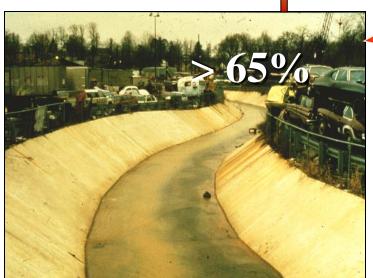

### The Problem

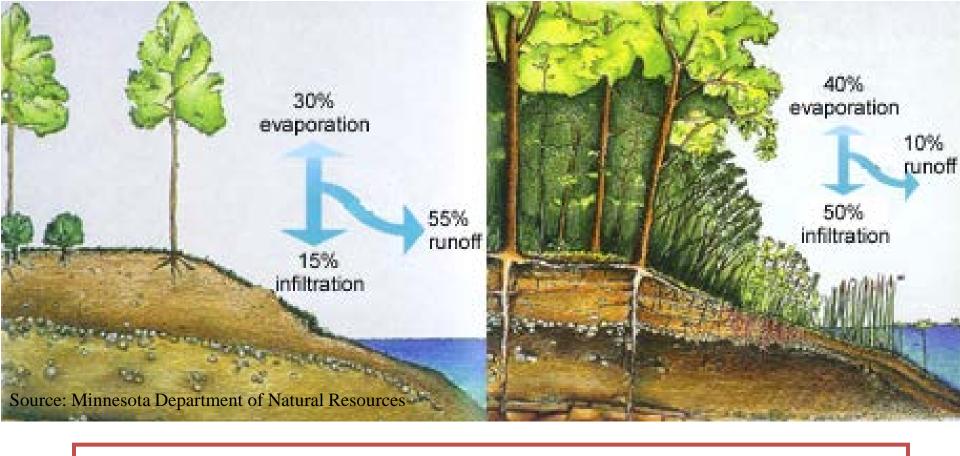

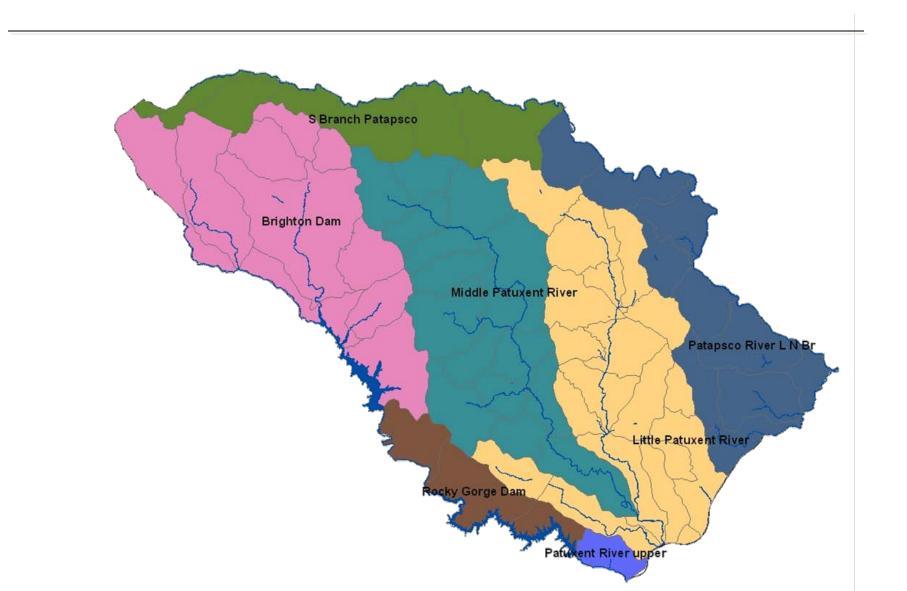

**County = 13.6% Columbia ~ 15%-20%** 

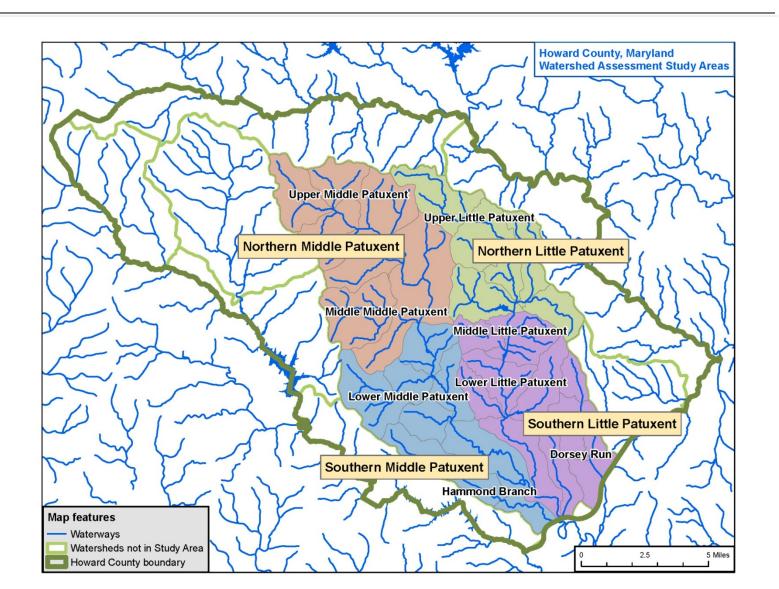

Water quickly runs off a shoreline cleared of natural vegetation, washing nutrients and pesticides into the water. A natural shoreline holds rainfall, which soaks into the soil; less water, soil and chemicals run into the lake or river. Shoreline and aquatic plants anchor shoreline areas, helping to protect them from erosion due to runoff and waves (Source:MN DNR)

## **County Watersheds**

## Breakdown of Study Areas

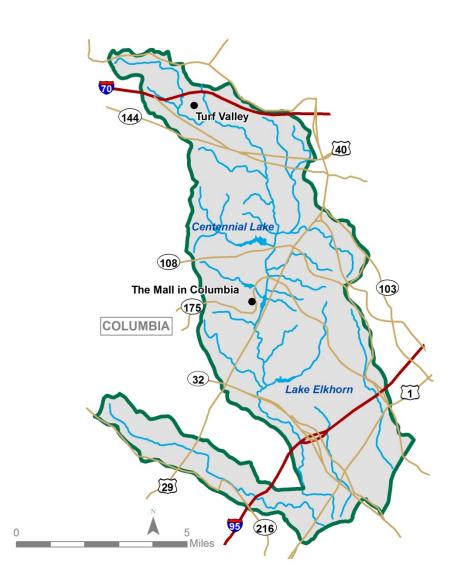

#### Watershed Characteristics

#### Little Patuxent River Watershed

#### **Little Patuxent River**

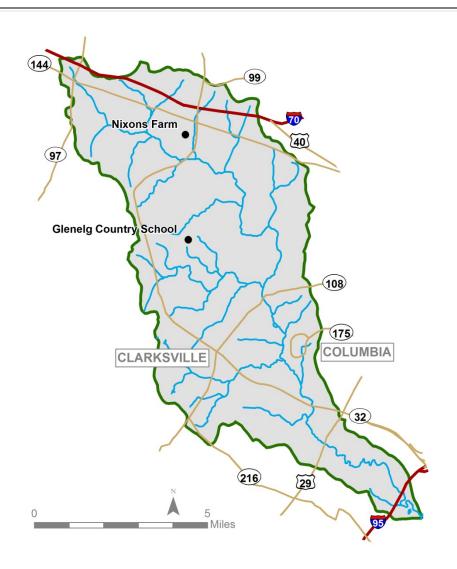

- 59 square miles
- 37,727 acres
- 9,688 impervious acres
- 9,043 wooded acres
- 190 miles of streams
- 1,746 stormwater
  BMPs treating 47
  acres of impervious

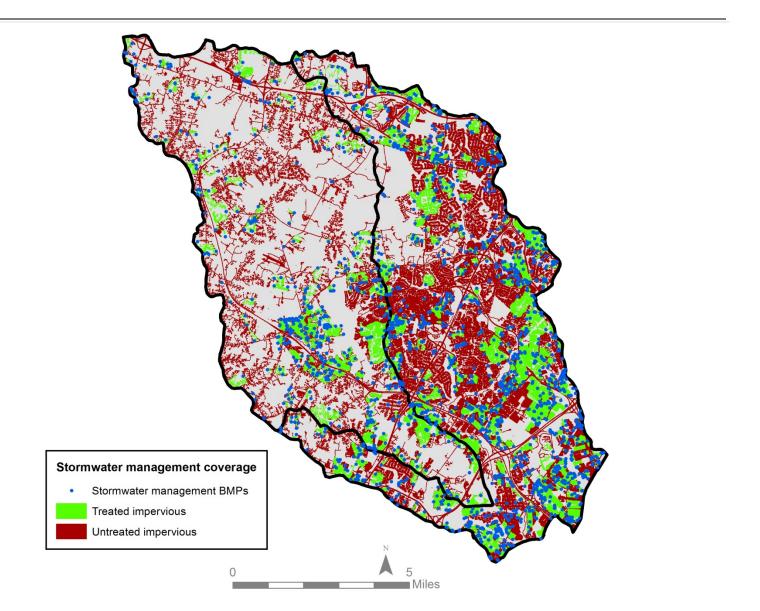

#### Middle Patuxent River Watershed

#### **Middle Patuxent River**

- 58 square miles
- 37,074 acres
- 3,675 impervious acres
- 12,367 wooded acres
- 227 miles of streams
- 593 stormwater BMPs treating 40 acres of impervious

#### Stormwater BMPs

#### Watershed Study – Phase 1

- Completed mid-July 2015
  - Desktop Analysis
  - Handheld Tablet Setup and Programming
  - Consultant Field Calibration and Training
  - Field Assessment (Approx. 3 months)
  - Review and Compile Field Data
  - Late June 2015 Community Meetings #1
  - Prepare Site Ranking and Prioritization

#### **Project Types Investigated**

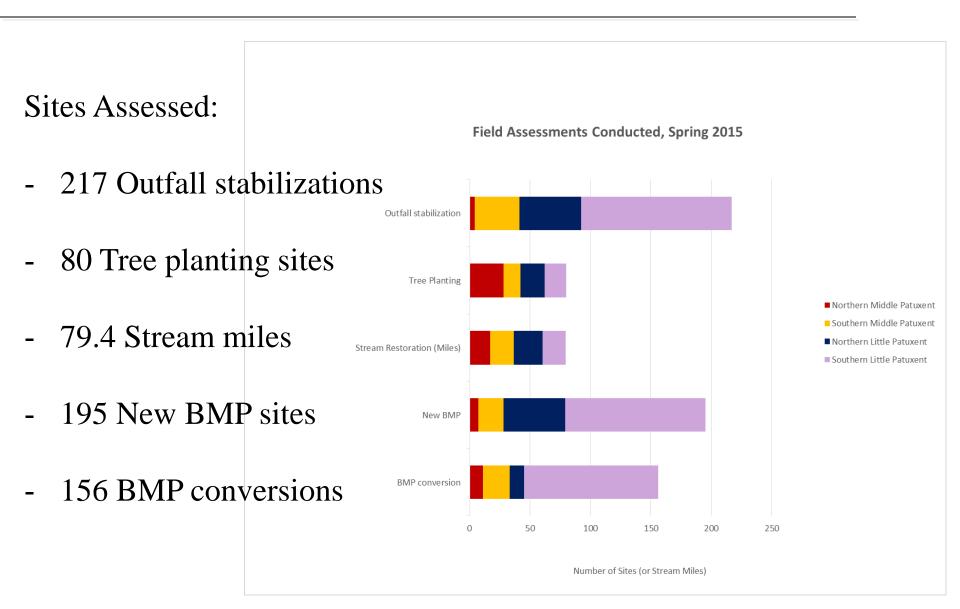

- Retrofit of Existing BMPs
- New BMPs
- Outfall Stabilization
- Stream Restoration
- Reforestation/Riparian Buffers

#### Field Assessments and Results

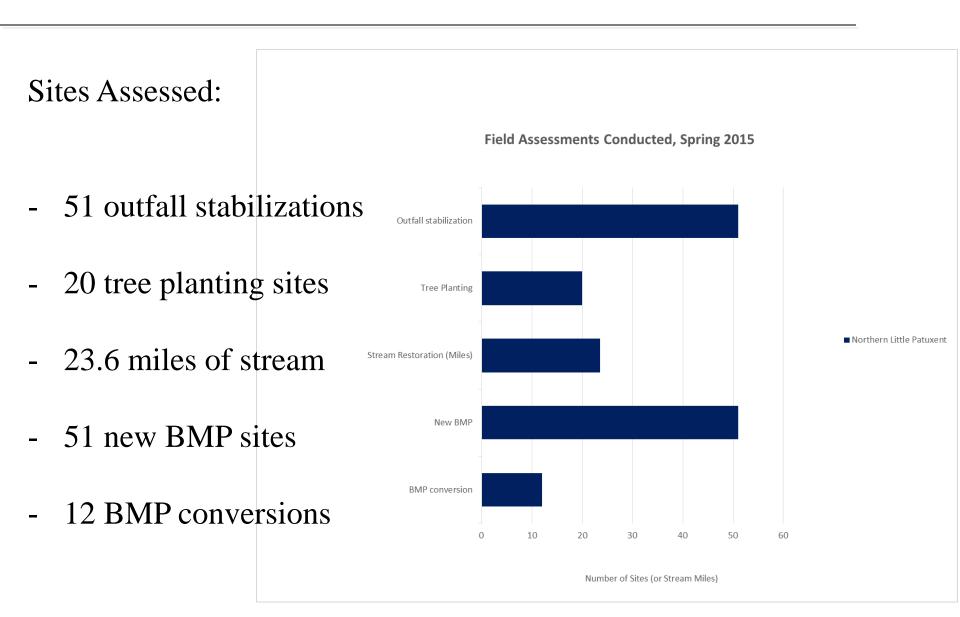

#### Field Assessment

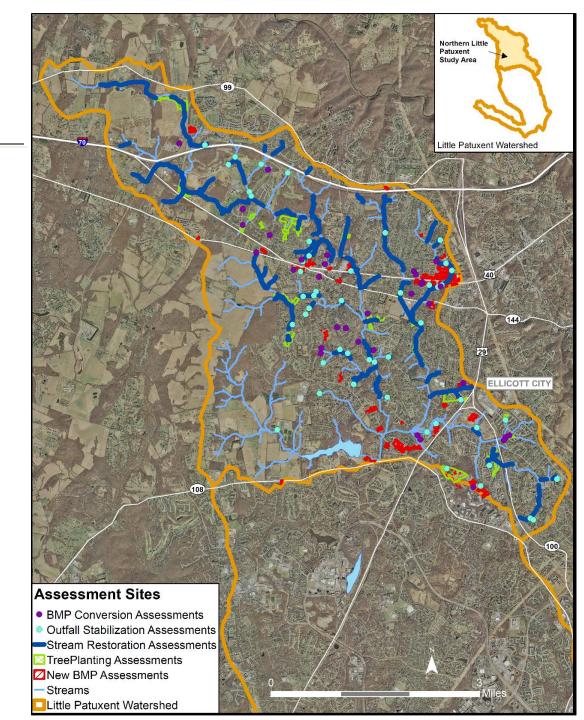

#### Field Assessment Results – Total

#### Field Assessment Results – NLP

## Field Assessment Sites – NLP

#### Watershed Study – Phase II

#### Scheduled completion end of 2015

- Perform Concept Level Designs (Including Cost Estimates)
- Rank sites (\$/acre of impervious treated)
- Input to restoration plan (CIS)
- Generate Draft Watershed Report
- Community Meetings #2
- Review and Comment Period
- Report to MDE December 17, 2015

#### Site Ranking Factors

#### Feasibility

- Ease of access
- Conflicts with infrastructure or other site constraints
- Adverse impacts to nearby trees
- Ownership public vs. private
- Pond/infrastructure already in need of repair
- Field assessment high potential for restoration/retrofit
- Site preparation required before planting
- <u>Biological uplift</u> additional benefits, such as augmenting existing green infrastructure or protecting wetlands
  - Within 500 feet of Green Infrastructure Network or High Quality (Tier II)
    waters
  - Planting is within 100 feet of wetlands

#### Site Ranking Factors

- <u>Permit contribution</u> how project will help meet MS4 impervious treatment requirements and TMDL pollutant reduction goals
  - Acres of impervious treatment
  - Pollutant load reduction factor (Sum of % load reductions for TN, TP, and sediment)
  - Cost per acre of impervious treatment
- <u>Programmatic benefit</u> value beyond primary functional purpose
  - Site has educational value and/or is visible for public demonstration
  - Site is near 2 or more other potential projects allowing for easier monitoring and demonstration of benefit

#### Site Ranking Factors

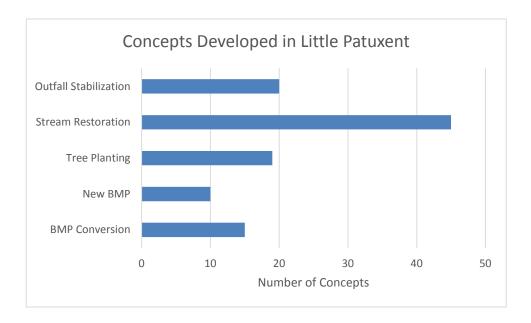

- <u>Erosion factor</u> (stream and outfall stabilization projects)
  - Length and severity of erosion

- Stream condition factors (stream projects)
  - Average Bank Erosion Hazard Index score
  - Habitat Assessment score
  - Number of other problems along reach (exposed pipes, pipe outfalls, unusual conditions, etc.)

### Site Assessment – Scoring Results

#### Little Patuxent Watershed

#### **Concept Plans - Total**

#### Concepts Prepared:

- 26 Outfall stabilizations
- 60 Stream restorations
- 32 Tree planting sites
- 10 New BMP sites
- 20 BMP conversions

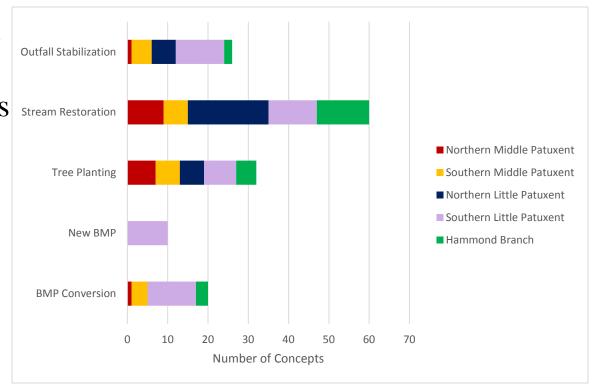

- 148 Total

#### Concept Plans –NLP

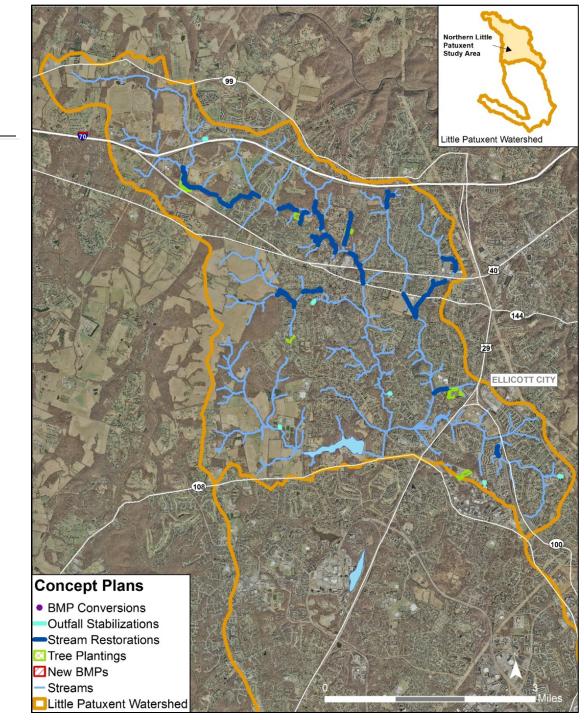

#### Concepts Prepared:

- 6 Outfall stabilization
- 20 Stream restorations Stream Restoration
- 6 Tree planting sites
- 0 New BMP sites
- 0 BMP conversion

32 Total

## Concept Plan Sites – NLP

## Concept Plan - Typical

Site ID: SR-37 Contractor: Biohabitats

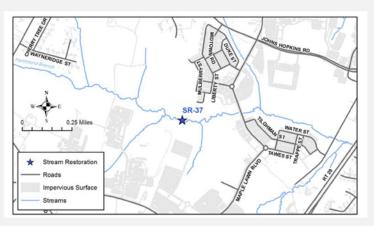

Site Name: Hammond Branch (d) - Reservoir High School Watershed: Little Patuxent River

Ownership: Private-Commercial/Industrial

Multiple Owners

#### **Existing Conditions:**

This project site includes two stream assessment sites: SMP-SR-F336A and SMP-SR-F338A. SMP-SR-F338A is upstream of SMP-SR-F336A on Hammond Branch. A BGE ROW runs the length of the site, with very little overhead cover and shade. SMP-SR-338A is located near Cedar Lane School and Lime Kiln Middle School, while SMP-SR-F336A is near Reservoir High School. The stream has moderate erosion occurring along both the left and right banks ranging from 3 to 5 ft. in bank height for most of the length. The upstream reach (SMP-SR-F338A) has a long section of eroding bank over 9 ft. in height, the right bank has very high eroding banks cutting into the hillslope near the school. The instream habitat within the existing channel scored in the marginal range overall. The epifaunal substrate upstream is poor with less than 20% stable habitat; however, as the stream moves downstream the epifaunal substrate becomes better and consists of 40-70% stable habitat favorable for epifaunal colonization with desirable habitat and some disturbed substrate not ready for colonization yet. Embeddedness throughout the stream is higher at the upstream end and continues to decrease as the stream moves downstream with an average of 25-50% of gravel, cobble, and boulder particles surrounded by fine sediment. The velocity/depth regime of the channel is suboptimal with three velocities present throughout the stream. Severe sediment deposition occurs within the upstream portion of the stream with 50% of the bottom affected and bar formations are occurring along the stream banks. As the stream moves downstream, only 30% of the bottom is affected by sediment deposition. The channel flow status is suboptimal throughout the stream with water filling on average 75% of the available channel and some riffle substrate exposed. Bank stability is moderately unstable on both the left and right side of the stream with 30-60% of the stream banks having some cover and increased erosion during floods. Vegetative protection along the left and right bank is marginal with an average of 70% of the stream bank surface covered. Shading along the existing channel is poor (10%).

Site ID:

SR-37

Site Name: Hammond Branch (d) - Reservoir High School

Contractor: Biohabitats

Watershed: Little Patuxent River

Facing downstream, an average 4 ft. recently eroded bank.

Facing downstream, very high eroded banks cutting into the hillslope near the school.

Site ID: SR-37 Contractor: Biohabitats

Site Name: Hammond Branch (d) - Reservoir High School Watershed: Little Patuxent River

#### Constraints/Utilities:

Both site assessments are mainly within a BGE ROW and are in close proximity to multiple schools. There are electrical power lines overhead and transmission poles along the stream that can make the site hazardous during construction. A sewer line does cross the stream and runs along a small portion of the stream. Very minimal tree impacts are anticipated due to a lack of overhead cover.

#### **Concept Description:**

The objective for this project is to reduce bank erosion and improve instream habitat for aquatic organisms. To improve instream habitat, either the stream invert can be raised or a new floodplain can be graded to reduce bank erosion and promote floodplain reconnection. In addition, grading banks back to a stable angle and stabilizing them with native vegetation to hold soil in place will help reduce bank erosion. Adding woody debris, cobble riffles, pools, and other nature-like habitat structures will reinforce the stream bed and banks, improve the flow diversity and structural complexity of the stream bed, and uplift the instream habitat. The proposed channel restoration work would occur predominately on the existing channel alignment; however, some minor realignment may be necessary where the stream is cutting into the hillslope. Maximizing riparian buffer will increase the shading to reduce the stream temperature and provide needed litter inputs and woody debris. This channel restoration has the potential to reduce the sediment supply, improve habitat, provide opportunities for nutrient uptake, and serve as an outdoor learning laboratory for the surrounding schools. The site can be accessed from the BGE access road and/or the nearby school. There are seven other nearby project recommendations that should be concurrently implemented with this site including five stream restoration sites and two tree planting site. These nearby projects include: SR-33, SR-34, SR-35, SR-36, SR-38, SMP-TP-F405A, and SMP-TP-F406. The outfalls from the area being developed on the reach between here and SR-38 should be modified so that the flow passes to the stream through a channel, not sheet flow so as to limit future headcutting up to the outfall.

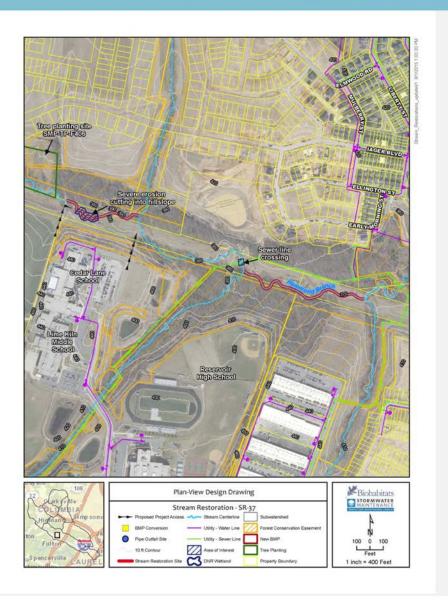

#### **Nearby Opportunities:**

SR-33, SR-34, SR-35, SR-36, SR-38, SMP-TP-F405A, SMP-TP-F406

### Watershed Assessment Summary:

- Confirmed large number of restoration opportunities
- More need/potential projects in Little Patuxent than Middle Patuxent
- Streams scored higher, more cost efficient, and plentiful
- Approx. 75% of projects on private property
- 148 projects will make a big dent in our permit requirements . . . and our checkbook

### Watershed Study - Next Steps

- Master list for developing annual Capital Budget requests
- Help define total budget and manpower needs to meet permit conditions
- Input to CIS restoration plan
- Private property approach needed
- Public review and submittal to MDE
- Provide lessons learned for next watershed study – Patapsco River and Patuxent River

### Can't wait for restoration projects . . .

## Riparian Buffer Enhancement

#### Alternative BMPs

### Can we get credit from MDE?

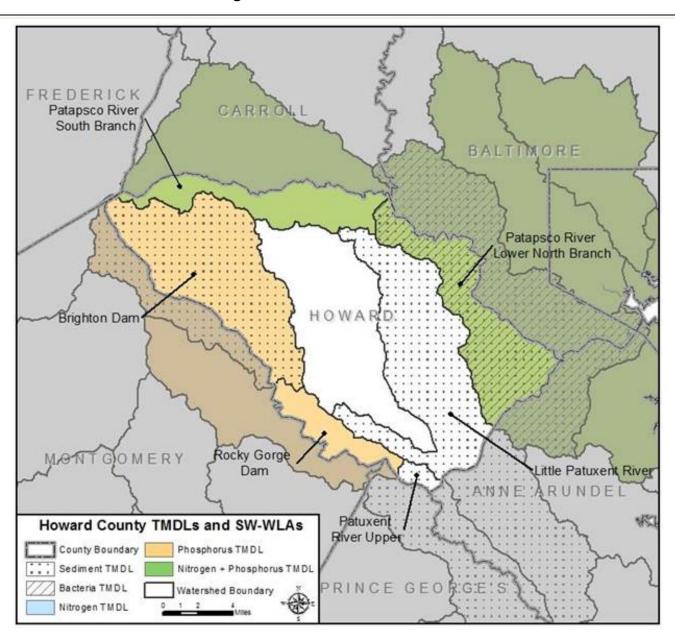

## Countywide Implementation Strategy (CIS) - Overview

- It's our Restoration Plan
- Blue print for NPDES permit compliance, meeting TMDLs, and environmental improvements
- 30-day public review period
- Submittal to MDE December 17, 2015
- Review annually
- Consists of nine chapters

#### <u>Chapter 1 – Background and Purpose</u>

- NPDES MS4 Permit requirement
- Chesapeake Bay TMDL and Local TMDLs
- Middle Patuxent no local TMDLs
- Impervious baseline determination
- Impervious area treatment 20% of untreated
- Summary of previous studies

## Howard County TMDL Watersheds

#### **Howard County Local TMDLs:**

Patapsco - Lower North Branch

Baltimore Harbor

Little Patuxent

Patuxent – Upper

Triadelphia Reservoir

(Brighton Dam)

Rocky Gorge Reservoir

#### <u>Impairment</u>

Sediment, Bacteria

Nitrogen, Phosphorus

Sediment

Sediment

Sediment

**Phosphorus**

#### <u>Chapter 2 – Causes and Sources of Impairment</u>

- Biological impairments
- Nutrients, sediment, bacteria
- Land use/Land cover
- Impervious areas
- Anticipated growth

| Watershed                  | <u>Impe</u> i | <u>rvious</u> |
|----------------------------|---------------|---------------|
|                            | Acres         | Percent       |
| South Br. Patapsco         | 744           | 4.6           |
| Patapsco - Lower North Br. | 4,425         | 18.3          |
| Middle Patuxent            | 3,411         | 9.2           |
| Little Patuxent            | 9,140         | 24.0          |
| Patuxent – Upper           | 440           | 25.5          |
| Triadelphia Reservoir      | 1,830         | 5.0           |
| (Brighton Dam)             |               |               |
| Rocky Gorge Reservoir      | 585           | 7.3           |

#### <u>Chapter 3 – Management Measures</u>

- Watershed assessments (current/future)
- Summarizes Little/Middle Patuxent; projections for Patapsco/Patuxent
- Modeling approach (MAST Maryland Assessment Scenario Tool & BayFAST)
- BMPs types and efficiencies for pollutant removal

#### <u>Chapter 4 – Load Reductions/Impervious Treated</u>

- Summaries based on Actual Implementation and Planned Implementation
- Bay TMDL and Local TMDLs
- By BMP types and subwatershed
- Compare results to goals

## Cost Summary Estimate

#### <u>Chapter 6 – Public Participation/Education</u>

- Lists current environmental outreach
- This meeting is part of Public Outreach
- 30-day public review/comment period

#### <u>Chapter 7 – Implementation Schedule</u>

- Lists various milestones
- Provides possible schedule for attaining goals

### Goals met?

Based on all projections and assumptions in CIS:

- 20% impervious acres MS4 permit condition met by end of 2019
- Local TMDLs known TMDLs met by 2027 (some earlier)
- Bay TMDL (Urban Stormwater Sector)
  - By the numbers: TP, TSS met; TN partially met by 2025
  - By MS4 permit all met if achieve 20% impervious treatment goal

#### <u>Chapter 8 – Load Reduction Evaluation Criteria</u>

- 2-year interim milestone reporting (State)
- Annual NPDES reporting
- Triennial BMP inspections
- Regular evaluation and adaptive management

#### <u>Chapter 9 – Monitoring</u>

- Current monitoring biological, chemical, physical (NPDES permit condition and voluntary)
- Stormwater Design Manual (NPDES permit condition)

#### In Summary:

- Comprehensive summary of County's current and proposed efforts for environmental restoration and permit compliance
- Planning document including possible schedule and anticipated costs
